Primary sclerosing encapsulating peritonitis, also known as abdominal cocoon syndrome is an unusual cause of bowel obstruction. If sclerosing encapsulating peritonitis may be secondary to peritoneal dialysis, tuberculosis, intraperitoneal chemotherapy or drug consumption, the idiopathic forms are exceptional. The physiopathology is an encasement of intestines by a fibrocollagenous membrane. This is a case of 53-year-old women with primary sclerosing encapsulating peritonitis admitted for bowel occlusion. Abdominal CT scan was performed (Figures A & B) and diagnosis was confirmed per-operatively (Figures C & D) [Video]. The patient was discharged in day 3. Etiological investigations were negative concluding to an idiopathic form of sclerosing encapsulating peritonitis.
